1. Richard Brown and Gretchen Davis have analyzed the following data to compare the ages of actors and actresses at the time they won Oscars:

Actors:	32 37 36 51 53 33 61 35 45 55 39 76 37 42 40 32 60 38 56 48 48 40 43 62 43 42 44 41 56 39 46 31 47 45 60 46 40 36
Actresses:	50 44 35 80 26 28 41 21 61 38 49 33 74 30 33 41 31 35 41 42 37 26 34 34 35 26 61 60 34 24 30 37 31 27 39 34 26 25 33

- (a) Construct a back-to-back stem-and-leaf plot for the above data. (7 pts)
 - (b) Find the median ages. (7 pts)
 - (c) Comment on the shapes of the distributions of the ages of actors and actresses and any similarities/differences between the two distributions. (6 pts)
2. The amounts of contamination (ppm) in a sample of 27 plastic specimens are given below:

30	30	60	63	70	79	87	90	101
102	115	118	119	119	120	125	140	145
172	182	183	191	222	244	291	350	511

- (a) Compute the sample mean. (5 pts)
- (b) Compute the median and quartiles. (5 pts)
- (c) Construct a box-plot. (5 pts)
- (d) Comment on your box plot of contamination. What are the important features of this plot? (5 pts)

3. Of patients going to a primary care physician's (PCP's) office, 30% are referred to a specialist, 40% require lab work, and 35% require neither lab work nor a referral to a specialist.
- (a) Determine the probability that a visit to a PCP's office results in both lab work and a referral to a specialist. (7 pts)
 - (b) Consider the case when five records of patients' visits to a PCP's office are selected at random. Find the probability that all 5 of them are referred to a specialist. (7 pts)
 - (c) Consider the case when another five records of patients' visits to a PCP's office are selected at random. Find the probability that at least one of them is referred to a specialist. (6 pts)

4. A study of automobile accidents produced the following results:

Model Year	Proportion of all vehicles	Probability of involvement in an accident during the first half of 2008
2006	0.16	0.05
2007	0.18	0.02
2008	0.20	0.01
2005 or older	0.46	0.06

- (a) An accident report for the first half of 2008 is chosen at random. What is the probability that the Model year for the car in this accident is 2008? (10 pts)
 - (b) A motor vehicle registration at the N.J. Motor Vehicle Bureau is selected at random. What is the probability that the model year of the vehicle in this registration record is 2005 or older and it is not involved in any accident during the first half of 2008? (10 pts)
5. A lot of 50 components contains 5 defective components. One of the 50 components is drawn at random on Day 1 and it is used in Assembly 1. A second component is drawn at random from the remaining 49 components on Day 2 and it is used in Assembly 2. Let F be the event that the first component drawn is defective, and S is the event that the second component drawn is defective. (5 pts each)
- (a) Find probability P(F).
 - (b) Find probability P(F and S).
 - (c) Find probability P(S).
 - (d) Are events F and S independent? Explain why or why not.

END
